

# Take photos marketing can actually use.

No camera settings to change. Scan the code, take the required shots, and retake anything the photo check flags.

Scan before taking site photos

Opens the field photo helper

1

## Wipe the lens

Dust, rain, fingerprints, and truck windows ruin photos before the work is even in frame.

2

## Stand still

Hold the phone with both hands. Tap the main subject on screen before taking the photo.

3

## Take 3 shots

Wide, medium, close-up. The helper checks for blur, low light, and low resolution.

## The 3 photos we need

1

### Wide

Show the full site context, crew scale, equipment, and surroundings.

2

### Medium

Show the crew, equipment, materials, or active work from a clear useful angle.

3

### Close-up

Show a clean detail that makes the work look professional and easy to understand.

## Retake the photo if

- It is blurry when you zoom in.
- It is too dark to see the work clearly.
- The photo was taken through a dirty windshield or window.
- The main subject is cut off or too close to understand.
- Fingers, tools, glare, or equipment block the view.
- The photo does not clearly show the people, equipment, work, or finished result.

**Simple rule: if the photo cannot support a campaign, LinkedIn post, or project story, retake it before leaving.**

One clear retake on site is faster than trying to fix a blurry, dark, or unusable photo later.
